

1. Overview & Role Architecture

This document specifies the dashboard requirements for every user role operating at the MCC (Milk Collection Centre) level within the Gemura Credit Platform. It supersedes and extends the platform-level dashboard specification by detailing the nine distinct roles within an MCC, their information needs, access permissions, and the critical traceability requirements introduced by the Umucunda (milk collector/aggregator) model.

The Umucunda model introduces a fundamental data challenge: a single physical delivery to the MCC gate may represent milk from multiple farms, mixed in transit. Because Gemura's credit engine assigns credit scores to individual farmers — and because VIBE Fluxx reporting requires per-farmer volume records — every litre that arrives via an Umucunda must be traced back to its source farm before credit records, payment, and quality flags are applied.

1.1 The nine MCC-level roles

Role	Category	Primary function
MCC Manager	Operations	Full operational view. Manages staff, capacity, daily totals, alerts, and Umucunda manifest compliance.
Veterinary Officer	Quality & traceability	Receives and tests every delivery at the gate. Records per-batch test results. Links results to constituent farms for Umucunda deliveries. Issues accept/reject decision.
Casual Laborer	Operations (task-based)	Assigned daily roles (gate recorder, weighing operator, tank monitor, cleaning). Task-focused view only. No financial or credit data.
MCC Leadership	Governance	Coop President and committee. Weekly/daily governance overview: volumes, revenue, compliance, member performance. Read-only, no PII.
Regulator	Compliance (external)	RAB, RURA, or district agriculture officer. Read-only compliance and capacity view. No farmer PII, no financial data.
Umucunda — Type A	Farmer + Collector	Registered farmer with own production. Also collects milk from neighbouring farms. Delivers mixed load. Must submit a farm-by-farm manifest. Earns both farmer milk income and a collection fee.
Umucunda — Type B	Pure Collector	No own production. Collects on behalf of farmers (may pre-pay). Delivers mixed load. Must submit manifest. Earns collection fee only. Has no credit score — manifest compliance is their performance metric.
Farmer (direct delivery)	Supplier	Delivers own milk directly to MCC gate. Simplest traceability path — every litre credited immediately to their record on vet acceptance.

Dashboard 6 — Umucunda Type A (Farmer-Collector)

8.1 User context

The Type A Umucunda is a registered dairy farmer who also provides a collection service for neighbouring farms. They wear two hats simultaneously: as a farmer, their own milk production contributes to their credit score and earns them the standard farmer milk price. As a collector, they earn a per-litre collection fee for milk gathered from other farms. Their dashboard must clearly separate these two revenue streams and show the manifest obligation for the collected portion.

8.2 Critical design requirement

The Type A Umucunda must never be incentivised to misrepresent constituent farm volumes — either to over-attribute to high-performing farms (to preserve their credit) or under-attribute to avoid rejection consequences. The manifest submission must be completed before the delivery arrives at the MCC where possible, or immediately at gate arrival. The platform must make manifest submission the easiest step in the delivery workflow.

8.3 KPI cards

KPI / Widget	Data / metric	Update freq.	Source	Notes & escalation rule
My own milk today	Litres from own farm	Real-time	Delivery log (farmer role)	Credited to own Farmer ID after vet acceptance
Collected for others	Litres from other farms in today's manifest	Real-time	Manifest engine	Credited to each constituent farm after vet acceptance
Total delivered today	L (own + collected)	Real-time	Gate scale	Authoritative volume — scale reading overrides manifest if different by >0.5L
My milk earnings today	RWF at farmer rate	Real-time	Wallet	Own milk only. Credited on batch acceptance.
Collection fee today	RWF at fee rate per L collected	Real-time	Wallet	For collected milk only. Held until manifest submitted.
My credit score	Score 0–100 + tier	Daily	Credit engine	Based on own production only. Collection activity excluded.
Manifest compliance — my record	% submitted on time (30 days)	Daily	Manifest engine	Target 100%. Persistent late manifests = suspension from collection route.

8.4 Main panels

Today's manifest — farm breakdown

Digital form (completed pre-delivery or at gate) showing each farm in today's collection route. For each farm: Farmer ID (auto-populated from route registration), container number, declared litres, and a volume entry field. Total declared must match gate scale reading within 0.5 litres. On submission, the platform assigns a manifest reference number and timestamp.

Earnings breakdown

Two-column view separating: (1) farmer income — daily milk value at farmer rate, monthly total, credit loan deductions if active; (2) collector income — daily collection fee, monthly total, pending (held) fees for unsubmitted manifests. Combined total at bottom.

My farms — collection route

Read-only list of farms registered on the collector's approved route. Shows each farm's recent delivery history (volume declared by collector), whether the farmer has verified the volumes, and any disputes flagged. A farm can only be added to or removed from the route by the MCC Manager.

- i The Type A Umucunda's credit score is calculated solely on their own farm production — volume, consistency, breed, quality. Their collection activity (manifested volumes for other farms) does not affect their credit score up or down. However, a manifest compliance rate below 80% triggers a review of their collection route licence.

Dashboard 7 — Umucunda Type B (Pure Collector)

9.1 User context

The Type B Umucunda has no dairy production of their own. They operate purely as a logistics intermediary between farms and the MCC. In some cases they pre-pay farmers for their milk at the farm gate (effectively buying the milk), deliver it to the MCC, and earn a margin or a per-litre fee. In other cases they collect on behalf of farmers and pass through the payment minus a collection fee. Both payment models must be supported by the platform.

9.2 Pre-payment model

Where the Type B Umucunda pre-pays farmers: the platform records the pre-payment as a collector advance against each farm. When the batch is accepted at the MCC, the farmer's payment is calculated, the advance is netted off, and any balance is sent to the farmer's wallet. The collector's advance is recovered from their collection fee. If the batch is rejected, the pre-payment remains as a collector loss — not recovered from the farmers — unless the Umucunda can identify the source of the rejection.

9.3 KPI cards

KPI / Widget	Data / metric	Update freq.	Source	Notes & escalation rule
Collected today	Total litres across all farms	Real-time	Manifest + gate scale	
Manifest status	Submitted / pending	Real-time	Manifest engine	Payment held until submitted. Farmer credits frozen.
Payment status	Released / held	Real-time	Wallet	Held if manifest not submitted or batch rejected
Collection fee due	RWF	Real-time	Wallet	At agreed per-litre rate. Released on acceptance + manifest.
Pre-payments made today	RWF paid to farmers	Real-time	Wallet	Deducted from collection fee on acceptance
Manifest compliance — 30 days	% submitted same day	Daily	Manifest engine	Performance metric for Type B (no credit score)
Route farms — volume summary	L per farm this month	Daily	Manifest engine	Summary of volumes attributed to each farm on route

9.4 Main panels

Manifest submission — required before payment

The manifest submission interface is the primary screen for a Type B collector. It is designed to be fast on a smartphone, with pre-populated farm IDs from the registered collection route. The collector enters litres per farm, confirms the total matches the gate scale reading, and submits. A manifest receipt is generated with a reference number.

Pre-payment tracker

Where pre-payment is used: a running record of advances made to each farm today and this month. On batch acceptance, this panel shows the net settlement: farmer's earned amount minus advance, with the balance shown for each farm. Any balance owed to a farmer is auto-sent to their wallet; any shortfall (if the batch volume came in lower than advanced) is flagged for manager review.

Compliance record

30-day manifest compliance chart showing: on-time submissions, next-day submissions, and overdue. This is the primary performance metric for a Type B collector. A rate below 80% triggers a warning. Below 70% for two consecutive months results in route suspension pending MCC Manager review.

i Type B Umucunda have no credit score and are not eligible for Gemura credit products in their collector role. They are registered as service providers, not as farmers. If they also have a farm of their own (registered separately), they may hold a separate Farmer ID and access credit in that capacity.
